

# Chapter 4

## Images and Lists in HTML

By: Ms.Chaitali Patel

# Recap...

- In the previous class, you learnt about the basic formatting tags used for designing a webpage in HTML. Some of these tags include <BODY>, <P>, <FONT>, <HR> and heading tags. The description and the attributes related to these tags are outlined in Table 4.1

Tag Name	Description	Attribute(s)
<BODY>	It encloses all the tags that describe the content and the layout of a webpage.	bgcolor, background, text, leftmargin and topmargin
<P>	It marks the beginning of a paragraph by inserting a blank line before and after the text.	align
<FONT>	It is used to change the appearance of the text to be displayed on a webpage.	face, color and size
<HR>	It is used to insert a straight horizontal line across a webpage.	color, align, noshade, size and width
Heading tags (<H1> to <H6>)	It displays the text in a larger and bolder font than the normal body text.	align

# Inserting images (<IMG>TAG)

- Images enhance the overall appearance of a webpage. Images make the websites look interesting.
- While designing the webpages, you should maintain a balance between the use of text and images. However, excessive use of images may slow down the download of a webpage.
- The image file formats that are supported by most web browsers include GIF, JPEG and PNG.
- In HTML, the images are inserted using the <IMG> tag. It is an empty tag. Table 4.2 lists the attributes of the <IMG> tag.

# Attributes of <IMG> tag

**Table 4.2** Attributes of <IMG> tag

Attribute	Description	Example
src	This attribute is used to specify the URL or the path of the image to be displayed.	<code>&lt;IMG src="flowers.jpg"&gt;</code>
height, width	These attributes are used to specify the height and width of the image in pixels.	<code>&lt;IMG height="200" width="200"&gt;</code>
align	This attribute is used to align the image with respect to the margins or the inline text. <ul style="list-style-type: none"><li>• Use <b>left</b> or <b>right</b> value to align the image with respect to margins</li><li>• Use <b>top</b>, <b>middle</b> and <b>bottom</b> to align the image with respect to inline text</li></ul>	<code>&lt;IMG align="right"&gt;</code>
alt	This attribute is used to specify an alternative text that a browser will display if the image cannot be displayed.	<code>&lt;IMG alt="flowers image"&gt;</code>
border	This attribute is used to specify the width of the border around an image.	<code>&lt;IMG border="6"&gt;</code>

# Attributes of <IMG> tag example

The following HTML code uses different attributes of the <IMG> tag to display the output as shown in Figure 4.2.

```

# Align Attribute of < IMG >

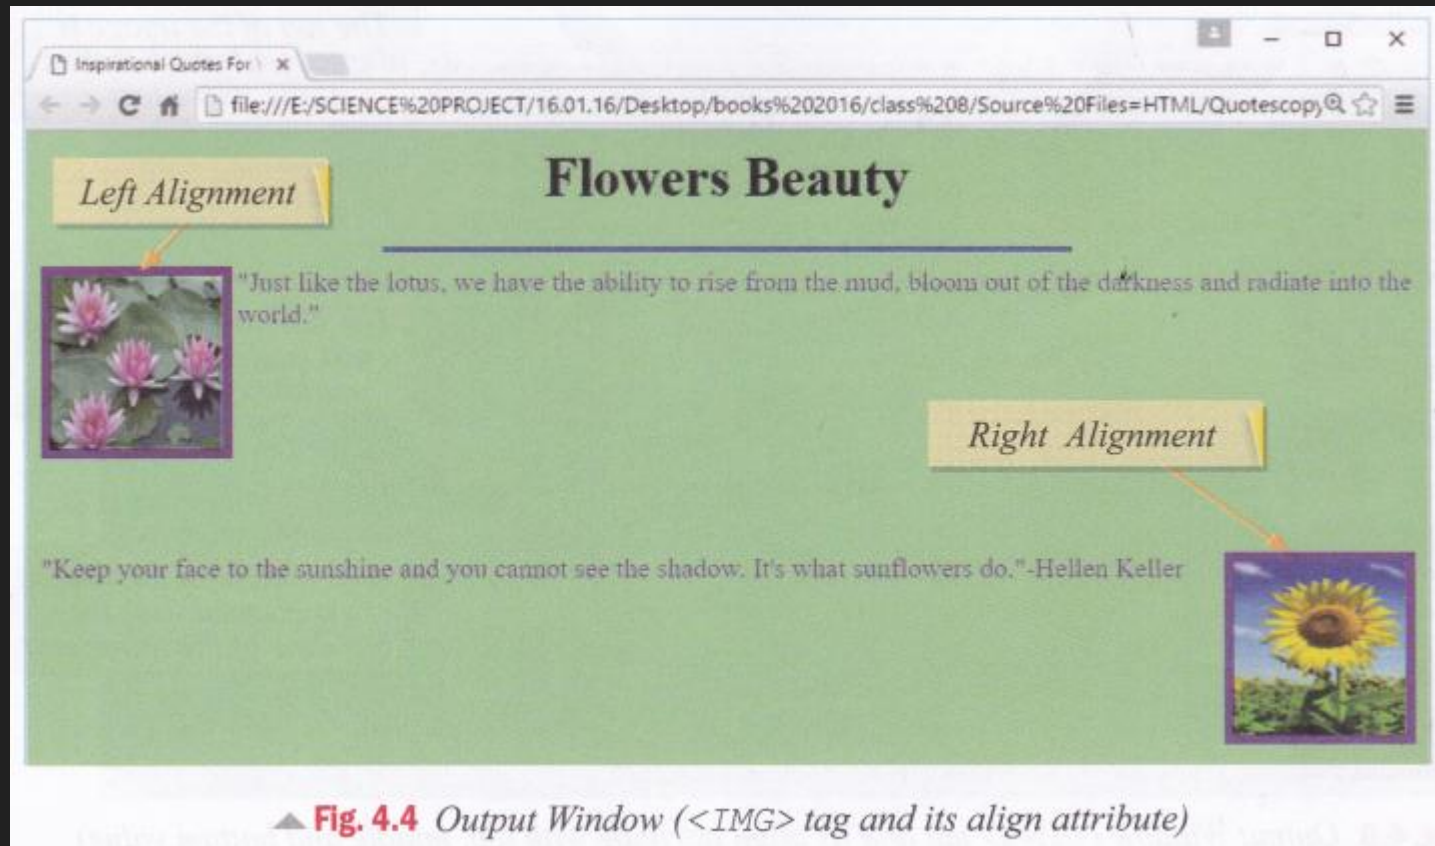

- **Using the Align Attribute of < IMG > Tag**

The align attribute of the <IMG> tag let us specify the placement of image on a webpage. To align an image with respect to the margins, we use left or right as the attribute value as shown in the following HTML code

```

# Align Attribute of < IMG > example

▲ **Fig. 4.4** Output Window (<IMG> tag and its align attribute)

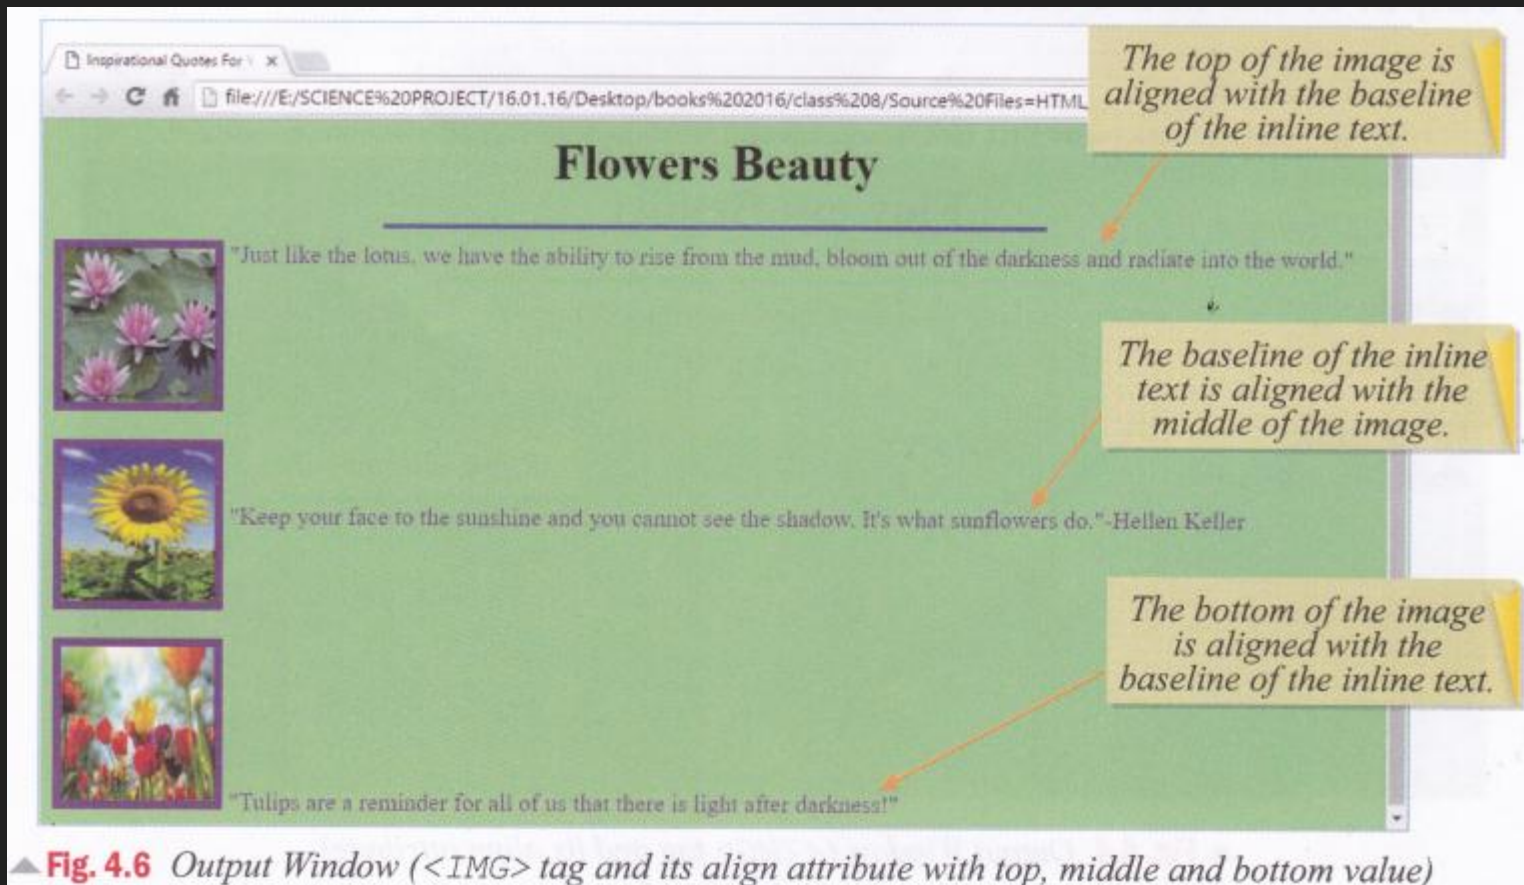

# Attribute of < IMG >

- The other three values that can be assigned to the align attribute are—top, middle and bottom. These values align an image with respect to the text on a webpage. The following HTML code uses these attribute values and displays the output as shown in Figure 4.6.

# CREATING LISTS

- Lists are a great way of organizing a lot of information in webpages. The two most commonly used lists are:
- Ordered list
- Unordered list

# Ordered List

- **Ordered List (<OL> Tag)**

Ordered lists, also called numbered lists, are used when the list items have a specific numerical order or ranking. An ordered list is enclosed within the <OL> and the </OL> tags.

- Each item in the list is marked using the <LI> (List Item) tag. The default numbering style is 1, 2, 3... and so on.

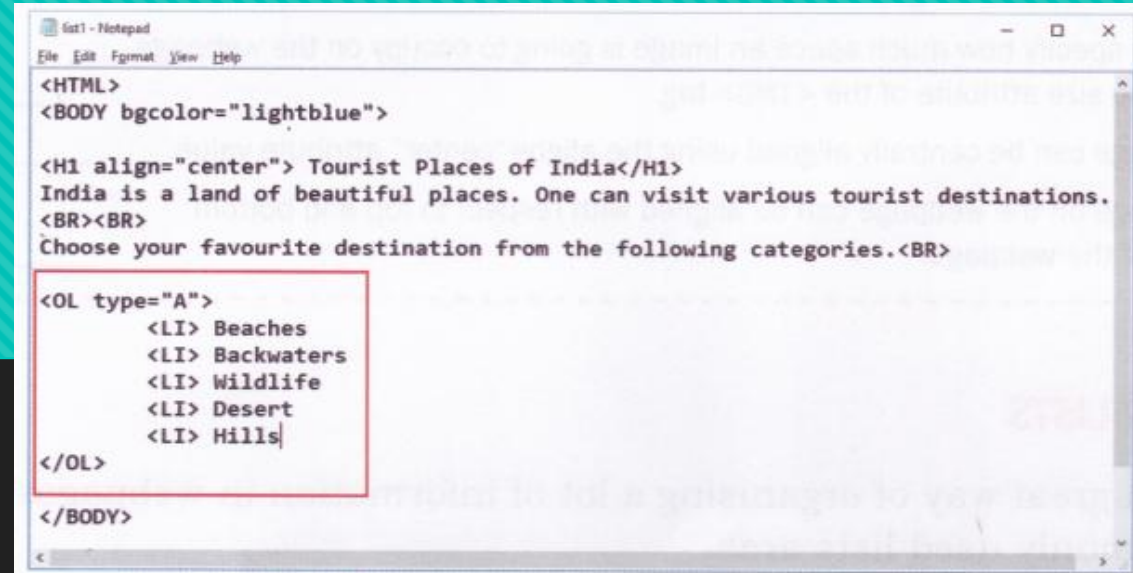

- Table 4.3 lists some of the important attributes of the <OL> tag.

**Table 4.3 Attributes of <OL> tag**

Attribute	Description	Example
type	This attribute specifies the type of numbering to be used for each list item. The values that can be given are—A, a, I, i, and 1(default).	<OL type=A / a / I / i / 1>
start	This attribute lets you start the list numbering from a different letter or a number, that is, other than the default numbers.	<OL start=n> where 'n' denotes a number

# Ordered list

- The following HTML code uses different attributes of the `<OL>` tag and displays the output as shown in Figure 4.8.

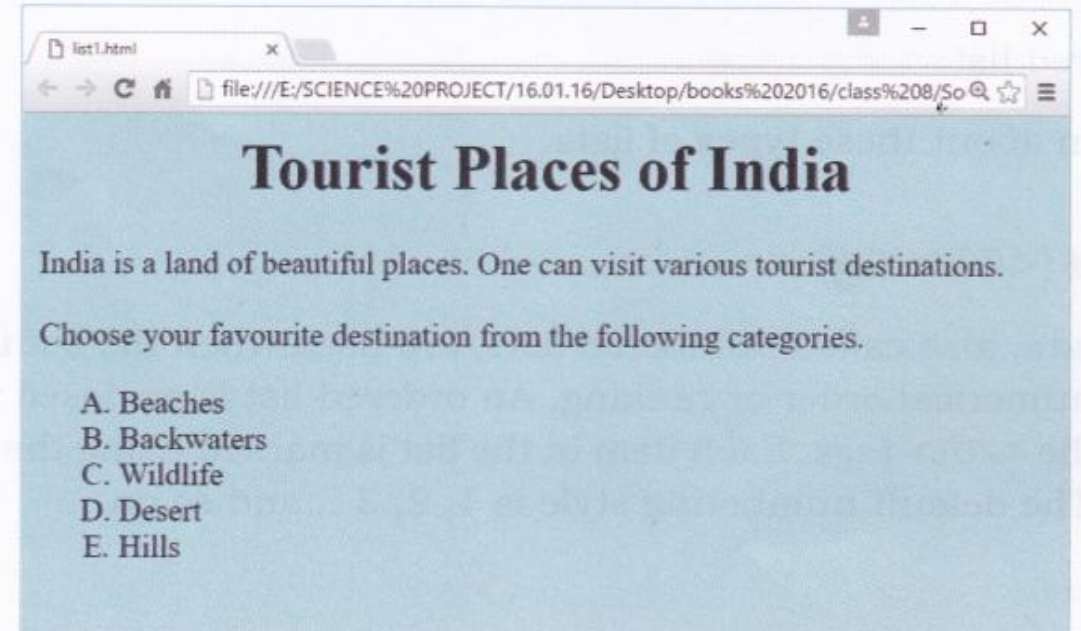

```
list1 - Notepad
File Edit Format View Help
<HTML>
<BODY bgcolor="lightblue">

<H1 align="center"> Tourist Places of India</H1>
India is a land of beautiful places. One can visit various tourist destinations.
<BR><BR>
Choose your favourite destination from the following categories.<BR>

<OL type="A">
  <LI> Beaches
  <LI> Backwaters
  <LI> Wildlife
  <LI> Desert
  <LI> Hills
</OL>

</BODY>
```

▲ Fig. 4.7 Using the `<OL>` tag and its type attribute

▲ Fig. 4.8 Output Window (`<OL>` tag and its type attribute)

# Attributes of OL tag

- Table 4.4 shows some examples of type and start attributes of the <OL> tag.

**Table 4.4** Examples of type and start attributes of <OL> tag

Type and Start Values	Output
<code>&lt;OL type="A" start="1"&gt;</code>	A. Beaches B. Backwaters C. Wildlife
<code>&lt;OL type="a" start="1"&gt;</code>	a. Beaches b. Backwaters c. Wildlife
<code>&lt;OL type="I" start="2"&gt;</code>	II. Beaches III. Backwaters IV. Wildlife
<code>&lt;OL type="i" start="3"&gt;</code>	iii. Beaches iv. Backwaters v. Wildlife
<code>&lt;OL type="1"&gt;</code> or <code>&lt;OL&gt;</code> (default)	1. Beaches 2. Backwaters 3. Wildlife

# Unordered Lists (<UL> Tag)

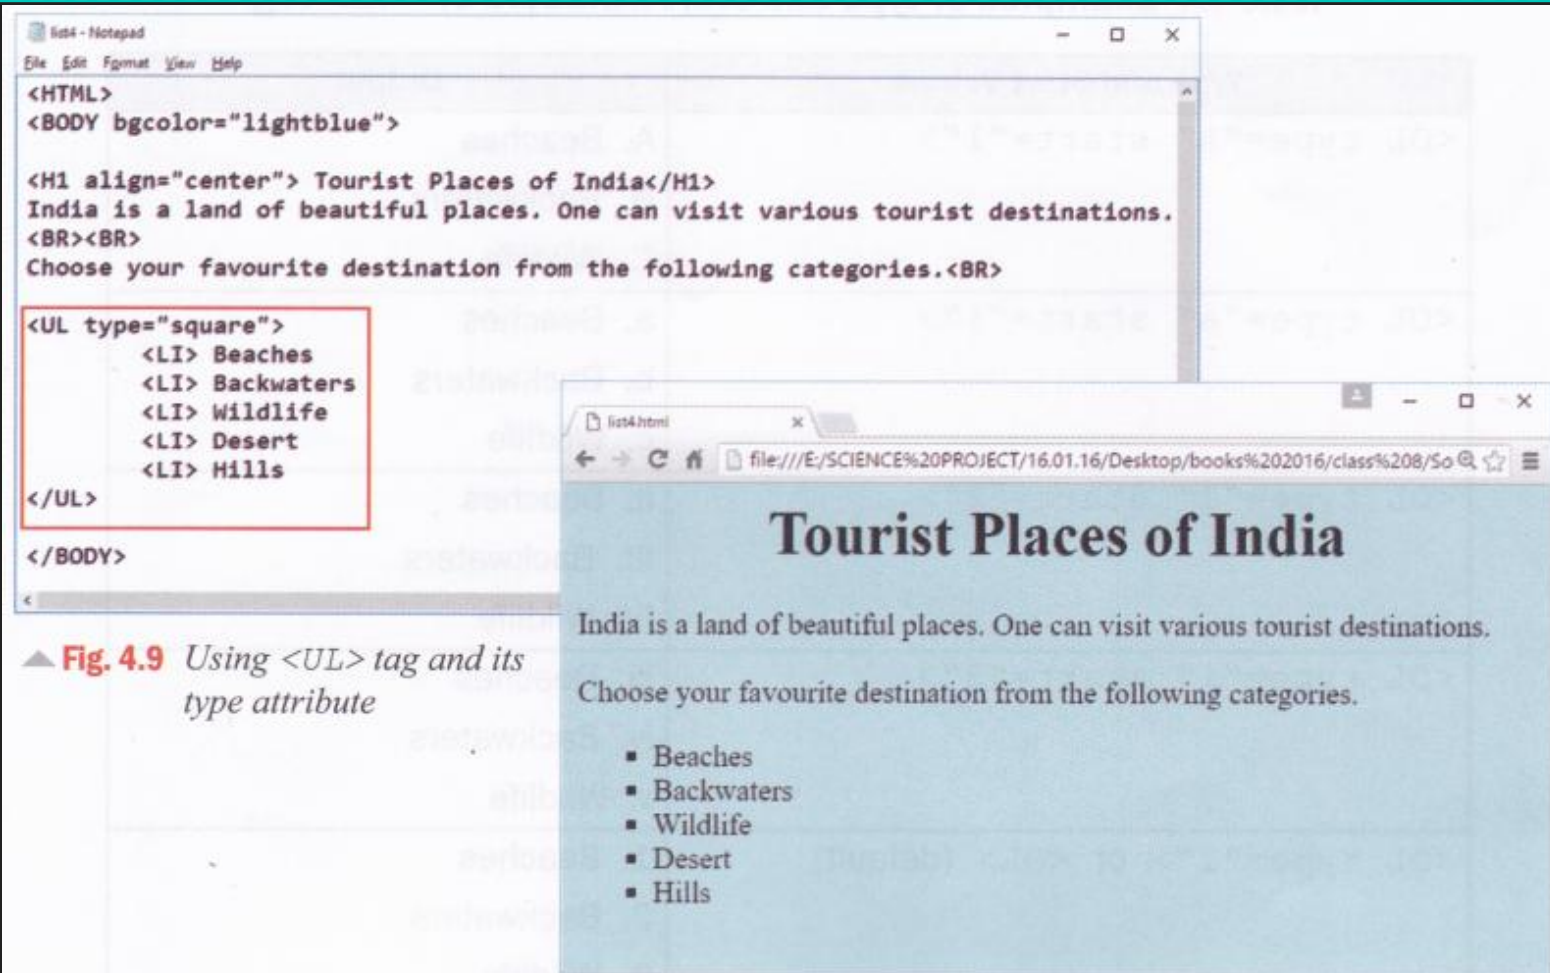

- Unordered lists are also known as bulleted lists. In unordered lists, the list items do not have a specific order. An unordered list is enclosed within the <UL> and </UL> tags.
- Each item in the list is marked using the <LI> (List Item) tag.
- Table 4.5 lists the attribute of the <UL> tag.

**Table 4.5 Attribute of <UL> tag**

Attribute	Description	Example
type	This attribute specifies the type of bullet to be used for each list item. The values that can be given are disc (default), square and circle.	<UL type=disc/circle/square>

# Unordered Lists (<UL> Tag)

- The following HTML code uses the type attribute of the <UL> tag and displays the output as shown in Figure 4.10.

▲ **Fig. 4.9** Using <UL> tag and its type attribute

▲ **Fig. 4.10** Output Window (<UL> tag and its type attribute)

# Attributes of Unordered Lists (<UL> Tag) :

- Table 4.6 outlines the output displayed when you use different values for the type attribute of the <UL> tag.

**Table 4.6** Examples of type attribute for unordered lists

Type Value	Output
<code>&lt;UL type="disc"&gt;</code> or <code>&lt;UL&gt;</code>	<ul style="list-style-type: none"><li>• Beaches</li><li>• Backwaters</li><li>• Wildlife</li></ul>
<code>&lt;UL type="circle"&gt;</code>	<ul style="list-style-type: none"><li>○ Beaches</li><li>○ Backwaters</li><li>○ Wildlife</li></ul>
<code>&lt;UL type="square"&gt;</code>	<ul style="list-style-type: none"><li>▪ Beaches</li><li>▪ Backwaters</li><li>▪ Wildlife</li></ul>

# Nested Lists

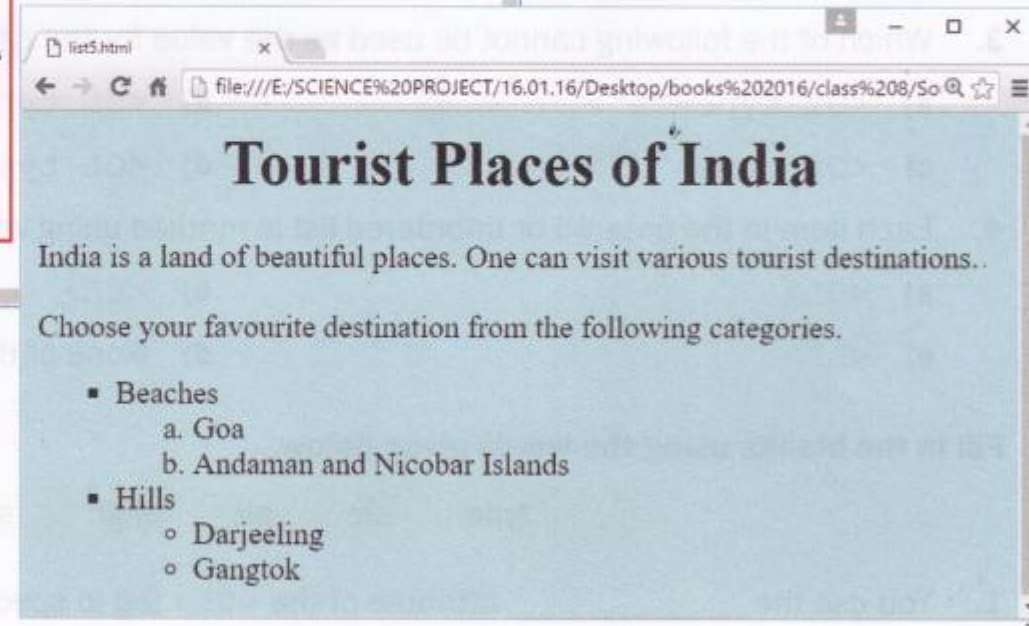

- Ordered and unordered lists can be nested within each other to form multilevel lists.
- The following HTML code displays the output as shown in Figure 4.12.

```
Get5 - Notepad
File Edit Format View Help
<HTML>
<BODY bgcolor="lightblue">

<H1 align="center"> Tourist Places of India</H1>
India is a land of beautiful places. One can visit various tourist destinations.
<BR><BR>
Choose your favourite destination from the following categories.<BR>

<UL type="square">
<LI> Beaches
  <OL type="a">
  <LI> Goa
  <LI> Andaman and Nicobar Islands
  </OL>
<LI> Hills
  <UL type="circle">
  <LI> Darjeeling
  <LI> Gangtok
  </UL>
</LI>
</UL>
</BODY>
```
